                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The protein sequence was deduced from the DNA sequence obtd. by CC screening a cDNA library made from AKR-2B mouse cells induced with CC TGF-betal and cyclohexamide with two probes from untreated AKR-2B mc and AKR-2B mc cells treated with cyclohexamide and TGF-CC betal. The proteins encoded by hybridising colonies (beta-1G-M1) contain 38 Cys residues and are induced by TGF-betal. CC beta-1G-M1 displays 80 percent homology to the CEF-10 protein CC induced by v-src in chicken embryo fibroblasts and is identical CC induced by v-src in chicken embryo fibroblasts and is identical CC induced by v-src in chicken embryo fibroblasts and is identical CC deposed by v-src in chicken embryo fibroblasts and is identical CC deposed in quiescent balls 373 cells by serum treatment. Residues CC amino half of insulin-like growth factor (IGF) binding proteins. CC The C-terminal Cys rich region of beta-1G-M1. AC and CEF-10 contain CC cheminal Cys rich region of beta-1G-M1. AC and CEF-10 contain CC christian of the malarial circumsporozoite (CS) protein, which is CC to date (designated region II). This motif is also found in cother proteins which have cell adhesive properties that mediate CC cell-cell and cell-extracellular matrix interactions, such as CC TGF-beta induced genes are likely to be involved in mediation of CC differentiation.                                                                                                                                                                                                                                                                                                      The invention relates to extracellular matrix (ECM) signalling molecules involved in cellular response to growth factors. More particularly the invention is directed to cysteine-rich protein (Cyr61), and Cyr61-related proteins such as fibroblast secreted protein (Fisp12) and connective tissue growth factor (CTGF) and nucleic acid molecules encoding such proteins. The polypeptides of the invention are members of cysteine-rich secreted protein family. Human Cyr61 fragment is useful in methods for screening modulators of cell adhesion, cell migration, fibroblast cell proliferation, angiogenesis, wound healing and Cyr61-integrin receptor interaction. Modulator of Cyr61-integrin alphaybetas
                                                                                                                                                                                                                                  interaction is used for the preparation of a medicament for the treatment of atherosclerosis, heart disease, tumour metastasis, fibrosis, tumour growth, disorders associated with inadequate angiogenesis; aberrant granulation tissue development; aberrant fibroblast growth and wounds.                                                                                                                       The present invention describes human small CCN-like growth factor (SCGF). SCGF has vulnerary and osteopathic activities, and can be used in gene therapy. The SCGF polypeptides and polynucleotides can be used for treating muscle wasting diseases, and osteoporosis, and to stimulate wound healing and tissue regeneration, to promote angiogenesis and to stimulate proliferation of vascular smooth muscle and endothelial cell production. The present sequence represents a CNN family protein which is given in comparison with the human SCGF in the exemplification of the
                                                                         Sequence
                                                                                                                                                                                                                                                                                             Disclosure; Fig 2A-D;

                                                                                                       The present sequence represents a monocyte mature differentiation factor (MMDF) which maintains the life of macrophages for long per in liquid culture. MMDF can be used as an anti-cancer agent, an in activator and to treat infectious diseases.
                                                                       Sequence

The present invention provides the protein and coding sequences of a number of human shear stress response proteins. These are useful in diagnosis, treatment and screening of vascular diseases caused by arteriosclerosis, including heart failure, post-PTCA restenosis and hypertension.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of uterine leiomyoma or preventing uterine leiomyoma formation. The method comprises increasing the level of Cyr61 in leiomyoma tissue. The invention also describes compounds and compositions that stimulate induction of the Cyr61 gene and compounds that increase Cyr61 activity. The compositions and the method of the invention are useful for preventing uterine leiomyoma formation or inhibiting proliferation of uterine leiomyoma in a subject. The method is particularly useful for
                                                                                                                                        Homo
                                                                                                                                                                                                                                                                                                                                                                                  Human connective tissue growth factor-2 (CTGF-2).
                                                                                                                                                                                                                                                                                                                                       Human;

The present invention relates to a method for stimulating angiogenesis in CC a mammal. The method comprises administering a polynucleotide encoding CC connective tissue growth factor-2 (CTGF-2) or an active fragment or its CC derivative. The method is useful for stimulating angiogenesis in a mammal CC preferably human having ischaemia or restenosis or is treated for limb CC revascularisation which is leg or arm. The invention is useful for cC inhibiting tumour growth, where angiogenesis is utilised for enhancing CC inhibiting tumour growth, where angiogenesis is utilised for enhancing CC fixation and stabilisation of tissue implants and enhancing wound CC fixation and stabilisation of tissue implants and enhancing wound CC fixating, hence is useful for treating cardiovascular disease e.g. CC atherosclerosis, reperfusion injury such as heart failure, angina, cC ischaemia, and is also used to differentiate, proliferate and attract CC cells leading to regeneration of tissues which is utilised to repair CC replace or protect tissue damaged by congenital defects, trauma (burns, closer, etc.), age, disease (e.g. osteoporosis, periodontal disease, the content of the process of the content of the process of the content of th
                     ulcer, etc), age, unsease (constant) plastic liver failure), surgery including cosmetic plastic sequence is human CTGF-2. CTGF-2 gene is useful in

CC binding protein) promoter. Cyr61 has cytostatic activity. An antibody (I) CC which neutralises Cyr61 can be used to prevent or inhibit breast cancer CC cell proliferation by blocking sex steroid induced and growth factor CC induced synthesis of Cyr61 DNA, where the growth factor is epidermal, CC heparin binding epidermal or basic fibroblastic growth factor. (I) can be CC used to diagnose or stage breast cancer where the level of Cyr61 in a CC positive/suspect breast cancer cell is compared to the level in a CC normal cell, an increase in the level of Cyr61 compared to the level in CC comman tissue indicates the presence of breast cancer. The level of Cyr61 being determined by exposing the tissues to (I), and an increase in the level of bound antibody by the suspect/positive cell as compared to the level of bound antibody by the suspect/positive cell as compared CC to the normal tissue indicates the presence of breast cancer. The present cancer represents the human Cyr61 protein, which is used in the CC exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                              δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc in AAA4338 to AAA4439. The proteins can have activities based on the collection of activities and cells the genès are expressed in. Example of activities conclude: cytostatic; proliferative; vulnerary; immunomodulator; cantidiabetic; antiasthmatic; antirheumatic; antitarthritic; antidiabetic; antiasthmatic; antirheumatic; antitarthritic; concurrence and antiarthritic; concurrence and polypertotective; cardiant; thrombolytic; coagulant; concurrence; vasotropic; antipsoriatic and antiangiogenic. The concurrence and polypertides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Complynucleotides, polypeptides, antibodies, againsts and antagonists from the present invention may be used to treat immune disorders by activating cor inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune cells, altergic reactions, graft versus host disease and organ crejection, modulate haemostatic or thrombolytic activity, modulate cancers, cancers, cardiovascular disorders, neurological disease and crejection or viral infections. The peptides, nucleotides, antibodies, agonists and Anada4240 represent sequences used in the exemplification of the present invention.

The invention discloses the isolated human polypeptides, and polynucleotides encoding them, that have been designated SECX and NOVX. The polypeptides can be used for treating, or delaying, the onset of an angiogenic-associated disorder or treating a pathological state in a subject, preferably a mammal. They can also be used in determining the presence of, or predisposition to, a disease associated with altered levels of the polypeptides and polynucleotides of any one of the 12 sequences (SEC1-12), for raising antibodies, for identifying an agent that binds to, or that modulates the expression or activity of the polypeptide, for treating or preventing a NOVX-associated disorder (NOVI-8) and as a pharmaceutical composition comprising the polypeptide, polypeptide or the antibody. The polypeptides and polynucleotides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-JAN-2001;

They can also be used as immunogens to produce antibodies specific for the convential agonist and antagonist compounds. The sequences presented in cc ABG76937-ABG76956 are the human SEC1-12 and NOV1-8 proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modulator of angiogenesis, chondrogenesis, oncogenesis, cell adhesion, cell migration, cell proliferation, expand a popula of undifferentiated haematopoietic stem cells in culture and screen for a mitogen (claimed). Ex vivo methods for using mammalian extracellular matrix signalling molecules to preparablood products are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT94699). Cyr61 polypeptides can be expressed in transformed transfected host cells. Cyr61 can be used to modulate haematostasis, induce wound healing in a tissue, promote organ regeneration, improve tissue grafting or promote bone or proth implantation (claimed). It can also be used to screen for a capitation of continuous con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This protein sequence comprises human cysteine rich protein (Cyr61), an extracellular matrix signalling molecule. Its a acid sequence was deduced from a human placental cDNA clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             regeneration

                                                                                                                                                               c protein (Fisp12) and connective tissue growth factor (CTGF) and connective tissue growth factor (CTGF) and conclete acid molecules encoding such proteins. The polypeptides c of the invention are members of cysteine-rich secreted protein c family. Human Cyr61 fragment is useful in methods for screening c modulators of cell adhesion, cell migration, fibroblast cell proliferation, angiogenesis, wound healing and Cyr61-integrin c receptor interaction. Modulator of Cyr61-integrin alphavbeta3 c interaction is used for the preparation of a medicament for the treatment of atherosclerosis, heart disease, tumour metastasis, fibroblast growth, disorders associated with inadequate angiogenesis; aberrant granulation tissue development; aberrant fibroblast growth and wounds. Polynucleotides of the invention are useful in gene therapy. The present sequence is human Cyr61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              31-JAN-2000;

The GTGF polypeptides are structurally and functionally related to a family of growth factors which include IGF (Insulin-like growth factor), PDGF (platelet-derived growth factor), and FGF (fibroblast growth factor). CTGF-2 exhibits 89 percent identity and 93 percent similarity to CTy61 is a growth factor-inducible immediate early gene initially identified in serum-stimulated mouse fibroblasts. It encodes a member of an emerging family of secreted proteins which are also a group of cysteine-rich proteins. This group of GFs are important for normal growth, differentiation, morphogenesis of the cartilaginous skeleton of an embryo and cell growth. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1;

                                                                                                                                                                                                                                                                                                                                                                               CC (CTGF-2). CTGF-2 cDNA was isolated from a cDNA library derived from CC human foetal lung. In one instance, the cDNA was connective tissue growth factor-2 cDNA was isolated from a cDNA library derived from CC human foetal lung. In one instance, the cDNA was cloned into a CC contain foetal lung. In one instance, the cDNA was cloned into a CC cDNA was cloned into a COS cell expression vector, with prior CC cDNA was cloned into a COS cell expression vector, with prior CC cDNA was cloned into a COS cell expression vector, with prior CC contain the include IGF (insulin-like growth factor). PDGF (CC factors which include IGF (insulin-like growth factor), PDGF (platelet-derived growth factor) and FGF (fibroblast growth factor). This concretive family of cysteine-rich secreted proteins are important for CC normal growth, differentiation, morphogenesis of the cartilaginous skeleton of an embryo and cell growth. Their functions also include wound CC support tissue repair, implant fixation and stimulating increased bone cass. CTGF-2 may be used to enhance the repair of connective tissue and can therefore treat skin disorders e.g., acne, aging, CF fixation and stabilization of tissue implants inserted during CC external wounds. It can be used in the treatment of injured or depleted cone as it promotes the growth of connective tissue, bone and cementum CC and stimulates protein and collagen synthesis
